KRITI · PRODUCT ROADMAP

What to build next.

A ranked list of upcoming features for the Kriti resume builder, sorted into high, medium and low priority, with what each one is, why it matters and how big the job is.

3
High priority features, plus a launch checklist

4
Medium priority features

5
Low priority or later

How the priorities were set

High: saves students real time or removes a barrier on their first visit, and can be built with what the project already has.

Medium: clearly useful and keeps people coming back, but the product works well without it.

Low: nice to have, expensive for what it adds, or it needs a server, which would change the "nothing leaves your browser" promise.

Effort
Low: a day or two
Medium: about a week
High: more than a week

Impact
How much it helps a student finish and send a resume

Needs a server?
Marked on each feature. Most do not.

HIGH

Build these first

Biggest time savings for students, all possible without a server.

1 Import an existing resume (PDF)

Effort: medium | Impact: very high | No server

A student drops in their old PDF and the form fills itself with their name, contact details, education, experience and skills.

WHY

Most visitors already have a resume. Retyping it is the biggest reason people give up. The PDF reader (*pdfjs*) is already in the project.

NOTES

- Guessing which text belongs to which section is the hard part
- Fill what is clear, leave the rest for the user to fix
- Show a "check what we found" step before it saves

2 Cover letter builder

Effort: medium | Impact: high | No server

A short guided form that produces a one-page cover letter PDF in the same fonts and colours as the chosen resume template.

WHY

Students and freshers are asked for a cover letter almost every time. It keeps them in Kriti for the whole application instead of leaving for another tool.

NOTES

- Reuse the template's header so the two documents match
- Offer a few starting points: campus, internship, experienced hire
- Pull name and contact details from the resume automatically

3 Bullet-point helper for freshers

Effort: low | Impact: high | No server

Ready-made starter lines for common student situations, and a gentle check that flags weak phrases such as "responsible for" or "worked on".

WHY

A blank "Experience" box is hard for someone with no job history. Good starting lines turn college projects, clubs and fests into real content.

NOTES

- Written by hand, grouped by role, so no AI or server is involved
- Add it to the existing Check panel and the bullet editor
- Suggest stronger verbs and adding a number

Before launch (not features, but needed)

- **Set the feedback email.** *FEEDBACK_EMAIL* in *src/lib/feedback.ts* is empty, so bug reports and feature requests go nowhere yet.
- **Configure the host.** It must serve *index.html* for unknown paths, otherwise links like */resumes/...* fail when the page is refreshed.

MEDIUM

Worth doing next

These keep people coming back and make the product feel complete.

4 Job application tracker

Effort: low–medium | Impact: medium | No server

A simple table inside the browser: company, role, date applied, status, and which resume was sent.

WHY

Students apply to many places and lose track. It fits naturally next to My resumes and the job-match tool, and gives a reason to return.

NOTES

- Statuses: Saved, Applied, Interview, Offer, Rejected
- Link each row to one of the user's resumes
- Saved locally like everything else

5 Works offline, installable on a phone (PWA)

Effort: low | Impact: medium | No server

Add a web app manifest and a service worker so Kriti loads without internet and can be added to the home screen.

WHY

Everything already runs in the browser, so it only needs caching. Helpful for students on patchy mobile data, and it fits the privacy message.

NOTES

- Cache the app, fonts and the PDF worker
- Show a small "works offline" note
- Use the existing logo as the app icon

6 More resume checks

Effort: low–medium | Impact: medium | No server

Extend the Check panel with spelling hints, a reminder to add a LinkedIn link, a warning for very long bullets and a quick skim view.

WHY

The panel already scores strength and matches job keywords. More specific tips make the score feel trustworthy and actionable.

NOTES

- Spelling needs a small word list kept in the app
- Keep every tip short and one click to fix

7 Automated tests

Effort: medium | Impact: protects quality | No server

Tests that render every template with its sample data, plus tests for the store (create, copy, undo).

WHY

There are 100 templates and many options. One engine change can quietly break some of them. A test that renders each one and counts the pages catches that.

NOTES

- Start with the render-all-templates check
- Run it on every change before publishing

LOW Later, or only if needed

Costly for what they add, or they change how Kriti works.

FEATURE	EFFORT	SERVER?	WHAT IT IS, AND WHY IT IS LOW
● **8. Word (.docx) export**	High	No	Some job portals only accept Word files. Making it look right across 100 designs is a lot of work, so it comes after the features above. A PNG of page 1 for sharing is a smaller first step.
● **9. Hindi and regional-language interface**	High	No	Fits "Made for India" well, and the PDF already handles Indian scripts. The cost is translating every label and keeping the translations up to date.
● **10. AI rewriting of bullet points**	High	Yes	Genuinely useful, but it needs a paid API key and a backend, and it conflicts with "your details never leave your browser". Only consider it as an optional, clearly labelled feature.
● **11. Share a read-only link**	High	Yes	Needs hosting and storage, which means accounts or links that expire. This changes the product from private and local to online, so decide that first.
● **12. Trim the app size**	Low	No	The PDF engine chunk is about 1.3 MB and several font packages are listed in *package.json*. Worth doing for slow connections, but nothing is broken today.

Suggested order

- **Now:** set the feedback email and configure the host, then build **PDF import**.
- **Next:** bullet-point helper (small, quick win), then the cover letter builder.
- **After that:** application tracker, offline support, extra checks, and tests alongside them.
- **Only if there is demand:** Word export, regional languages. Server features wait until you decide to host something.
